Subject: Dr Battle and staff at Comprehensive Health Association

To whom it may concern:

I had a longstanding health issue for which there seemed to be no solution. I saw a number of doctors over the years and followed their recommendations, but with no success.

After reviewing Dr Battle's web site, I concluded his approach, techniques and years of experience could lead to the answer I was looking for.

I was not disappointed. He determined my adrenals needed support. The results were dramatic by following his recommendations.

My view is that the body is analogous to commercial metal reactors used to produce the variety of products we all enjoy as consumers. The body, however, is a biological reactor, more complicated than commercial metal reactors, but nonetheless, employs the same basic function - take feed components and produce the intended products.

As an example, feeding the right quality ethylene to a polyethylene reactor will yield good quality polyethylene (a plastic). Feeding low quality ethylene will yield low quality polyethylene. Feeding a foreign substance will yield something unintended. There is a saying that is applicable to both commercial reactors and the body's biological reactor: GI-GO, which stands for garbage in - garbage out.

Giving the body's biological reactor the correct feed components or those that support the correct reactions is usually the best approach. I believe Dr Battle's approach to helping the body heal is consistent with this view.

If anyone has any longstanding or chronic condition, Dr Battle may just have the remedy needed.

I am a chemical engineer with 40 years experience in the application of technology, which includes process design, research and development and technology licensing. Technology in this context is the application of all the elements necessary to produce the intended product or outcome. Some include the correct feed quality, catalysts, reactor type and conditions.
